To Whom It May Concern:

Re: Church & Dwight Arm & Hammer™ Sodium Bicarbonate – Microbiological Risk

The process conditions for manufacturing sodium bicarbonate are sufficiently harsh (high temperature, high pH) that microbiological activity as a result of raw materials or exposure during processing (closed system, continuously operated) is not a significant risk.

Because of its low water activity and lack of nutrient value, Arm & Hammer Sodium Bicarbonate powder does not support microbiological growth or the growth of yeasts and molds.

Please feel free to contact me with any questions.
